Bonded Filters

The secret to perfect coffee... every time

CHEMEX® Bonded Filters are 20-30% heavier than competitive brands and remove even the finest sediment particles as well as the undesirable oils and fats. The formulation of the filter permits the proper infusion time by regulating the filtration rate - not too slow, not too fast. Good infusion of the coffee grounds gives coffee a richer flavor while at the same time making possible precise fractional extraction filtering out the undesirable components which make coffee bitter by allowing only the desirable flavor elements of the coffee bean to pass through.

The CHEMEX® Bonded Filter is folded into a cone shape, exactly as in laboratory techniques. This assures uniform extraction since the water filters through all the grounds on its way to the apex of the cone. The CHEMEX® Bonded Filter is guaranteed not to burst under the weight of the liquid during filtration, and not to break when lifting out the grounds.

The perfect coffee starts with the perfect filter

- X Cone shape ensures uniform extraction for pure coffee flavor.
- X Thicker (20-30% more than the competition) fiber filter design keeps bitter elements, oils, and grounds in place and out of your cup.
- X Pre-folded and Unfolded Filter options available.
- X Oxygen cleansing is a bleach-free process, ensuring no chemical residue or taste is imparted to the filter.
